## **DETAILED ACTION**

1. This action is response to communication: amendment filed on 05/21/2007 with acknowledgement of priority date of 07/19/2003.

- 2. Claims 1-14 are currently pending in this application. Claims 1 and 8 are independent claims.
- 3. No new IDS has been received since the previous Office Action.

## Response to Arguments

Applicant's arguments filed 07/19/2003 have been fully considered but they are not persuasive.

As per claims 1-7, the applicants have amended the claims to recite "for protocol analysis, or procedure trace to be performed on deciphered data." However, this phrase does not limit the claim any further, as this phrase is a statement of intended use. To include this limitation in the claims, the applicants are suggested to recite actively performing this step, instead of reciting the intended use of the device.

As per claims 8-14, the applicants have amended independent claim 18 to recite performing protocol analysis, or procedure trace on the deciphered data. However, Takagi '474 indeed teaches this limitation, such as in paragraph 91: "The IP input unit 1423 judges whether the TCP relay processing is to be carried out or not according to the information of the original packet, and gives the packet to the TCP input unit 1405 by judging that the TCP relay processing is to be carried out. The most simple

Art Unit: 2134

judgment criterion is that all packets are to be relayed by utilizing the TCP connection as long as TCP is used..." This limitation has been added to the art rejection below.

# Claim Rejections - 35 USC § 112

4. The previous 112 rejections have been withdrawn in response to applicants' clear arguments.

# Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 6. Claims 1-4, 6, 7, 8-11, 13, and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Takagi US Patent Application Publication 2001/0047474 (hereinafter '474), and in view of Malek US Patent No. 4,920,567 (hereinafter '567).

As per claim 1, '474 teaches a system for communication monitoring in a mobile radio network comprising: a processing device coupled to multiple links in the mobile radio network (Figure 1, processing device gateway 401, 402, 403), the processing device (i) determining from data transferred via the multiple links current deciphering parameters (paragraph 18 and 74); (ii) deciphering the data using the current

Application/Control Number: 10/622,657

Art Unit: 2134

deciphering parameters to produce deciphered data (paragraph 18 and 90); a deciphering parameter providing device (paragraph 98) coupled to the processing device, in which the current deciphering parameters are filed by the processing device to be available for another processing device upon request (paragraph 101, 102); a deciphered data providing device coupled to the processing device for providing the deciphered data at an output (paragraph 91 and 92 radio output unit 1408) for protocol analysis or procedure trace to be performed on deciphered data (paragraph 91). The processing device and the deciphering parameter providing device are distributed over different locations and are coupled together by a communication link, as can be seen in Figure 1.

However, at the time of the invention, '474 does not explicitly teach an output device separated from a gateway/processing device which is connected by a communication link. Malek '567 teaches this though, in Figure 2, where remote interface forwards manipulated data to a PSTN (connected by a communication link) which forwards it to a gateway. This also teaches that the data sent from remote interface 206 may be decrypted (col. 7 lines 55-65).

At the time of the invention, it would have been obvious to one of ordinary skill in the art to combine the teachings of '474 with '567, as they are both directed toward secure communication in a mobile radio network. One of ordinary skill in the art would have been motivated to separate the output unit from the deciphering unit as to allow physical components to be more specialized, so as to be only dedicated to one process.

Application/Control Number: 10/622,657

Art Unit: 2134

As per claim 2, the claim recites wherein the communication link comprises one selected form the group consisting of a local area network and a wide area network. '474 teaches that the processor is connected to the deciphering parameter providing device through a network. The combination with '567 would teach that a output device would be connected in a similar manner. It would be inherent that if a communication link coupling devices together uses a network, (such as is taught in '474), it would be picked from a LAN and a WAN, as these two categories comprise all networks.

As per claim 3, '474 teaches wherein the processing means deciphers data on first ones of the multiple links using an additional deciphering parameter extracted from the data (paragraph 89 teaches that the packet deciphers data using a key and also an algorithm, which is extracted from the data); the data being in the form of packet data units (paragraph 89), the additional deciphering parameter being a set of parameters obtained from a subscriber data base entity (paragraphs 48-57), from the data flow of the connection (paragraph 89, Figure 1), and from each packet data unit as the sequence number of the packet data units (paragraph 89, where it teaches the packet has selector values; also paragraph 49-50).

As per claim 4, '567 teaches wherein the data includes both unciphered and ciphered data (col. 7 lines 50-65) and the processing device comprises: means for deciphering the ciphered data according to the current deciphering parameters (paragraph 90 of '474; col. 7 lines 55-65 in '567); and means for combining the unciphered data and the deciphered ciphered data to produce an ordered data flow as the deciphered data ('567 col. 7 lines 55-66).

As per claim 6, '474 teaches wherein the processing device comprises a memory coupled to the deciphering parameter providing device for storing deciphering parameters provided by the deciphering parameter providing device (paragraph 82).

As per claim 7, '474 teaches wherein the processing device comprises a plurality of processors operating in parallel with the deciphering parameter providing device and deciphered data providing device, the number of processors being sufficient to cover all the multiple links at a server switching entity (Figure 1, with plurality of processing devices 401, 402, and 403).

Claims 8, 9, 10, 11, 13, and 14 are rejected using the same basis of arguments used to reject claims 1, 2, 3, 4, 6, and 7, respectively. Also, as per claim 8, performing protocol analysis, or procedure trace on the deciphered data is taught in paragraph 91 of '474.

7. Claims 5 and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over '474 and '567 as applied above, and further in view of Low et al. US Patent No. 6,959,346 (hereinafter '346).

As per claim 5, the '474 combination does not explicitly teach delaying unciphered data while the deciphering means deciphers the ciphered data so the deciphered data is in the ordered data flow with the unciphered data. However, Low '346 teaches this in col. 6 lines 37-57, wherein information that is not decrypted remains

, applications control

Art Unit: 2134

and waits in the combiner, and the signal is combined with deciphered data once it is determined that the two sets of data correspond to each other.

At the time of the invention, it would have been obvious to combine the teachings of '346 with the '474 combination. One of ordinary skill in the art would have been motivated to perform such an addition to provide flexibility to the system, as taught in col. 3 lines 53-56 of '346.

Claim 12 is rejected using the same basis of arguments used to reject claim 5 above.

#### Conclusion

8. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.
